Join our study today to share your opinion on MPOX, HIV, and other diseases in Jails!

Participants Needed!

Emory researchers are looking to interview people who have lived experience of incarceration to learn how public health workers can better communicate messages about wastewater-based surveillance for infectious diseases in jail settings.

With many viral infections in the body, you can shed these germs in various ways like through sneezing, skin sores, urine, feces, vomit, and other body discharges. Our study will discuss looking in sewers for germs in the wastewater. After using toilets, sinks and showers, the germs in body fluids go down the drain and virus will appear in the sewer water. Jails have used this technology to monitor for coronavirus.

Eligibility:

- 18 years or older
- Previously been in jail
- Can speak and comprehend English
- Able to give informed consent
- Can meet via phone, Zoom, or in-person

You will be compensated for your time! Only required to complete one interview!
